

Blackout roof windows are a perfect solution in the following cases :

Layer houses wider than 24 metres.

According to KAT requirements daylight should be within 12 m of the animal. Theoretically you can build up to 48 m wide with blackout roof windows from Tulderhof.

Renovation of any stable.

Blackout roof windows are an excellent solution for any renovation where the stable doesn't require to the 3 % light demand yet. The windows are tailor made, so they fit exactly between the purlins.

In between the top -and bottom layer of the window movable slats are made to assure proper darkening when needed. The slats can be operated manually or with an electrical winch.

Blackout roof window

Technical information

Below you can see a technical drawing of a blackout roof window. When ordering we need the following measurements:

X= the exact size between the purlins

Y= the exact size between the bottom of the insulation and the bottom of the corrugated sheet

Z= the exact size between the bottom of the purlin and the bottom of the insulation
